

Project Guide - AI Time Capsule Project

Overview

This three-day project allows students to explore AI-assisted future predictions while making informed, ethical, and realistic assessments of AI's outputs. The focus is on refining AI-generated predictions, ensuring inclusivity and feasibility, and presenting their final vision for the future.

Your project will show that you can...

- ☐ Develop an AI-assisted future prediction by integrating research on past and present trends with AI-generated insights
- ☐ Evaluate AI-generated predictions for feasibility, inclusivity, and accuracy by identifying bias, missing perspectives, and real-world constraints
- ☐ Refine AI-generated predictions by iterating on prompts and applying human reasoning to improve clarity and alignment with real-world trends
- ☐ Work iteratively with AI to refine their final product to improve clarity, coherence, and engagement

Day 1: Iterating on Predictions

Choose a Focus Area

Do This: Circle or highlight one of the areas to make a prediction about:

- Technology
- Healthcare
- Sports
- Media
- Ethics
- Fashion
- Environment
- Entertainment
- Other: _____

Gather Data

Do This: Search online and collect both text documents and images related to your focus area. Download and save them to use with AI.

My Initial Prediction

Do This: Based on the artifacts you collected and your own knowledge, write an initial prediction about the future of your chosen area. Your prediction should describe a future at least 10 years from now.

My prediction for the year _____ is

AI Predictions

Do This: Go to Lesson 13, Level 1 and use AI Chat to refine and iterate on your prediction. Follow the steps in the level to improve accuracy, realism, and inclusivity.

Day 1 Reflection

1. How did AI influence or challenge your original prediction?

2. How did you adjust your prompt to reduce any inaccuracies or bias in AI's output?

3. Write your finalized prediction as an "I believe . . ." statement. (e.g., I believe that in [20] years, [GPS smart pants] will likely exist because . . .)

Day 2: Presentation of Process

Presentation Format

Do This: Choose a format that best showcases your process of creating your prediction. Examples include: infographic, slide presentation, podcast, or poster.

Develop Your Presentation

Do This: Start brainstorming what you want to include in your presentation. Use the space below to jot down notes or ideas if helpful.

Collaborating with AI

Do This: Go to Lesson 13, Level 2 and use AI as a collaborator to help you refine and improve the content or design of your presentation. Make sure your presentation includes:

- Your initial prediction
- AI's initial prediction
- Any inaccuracies or bias in the AI output
- How you changed your prompt to improve AI's response
- Your final prediction
- What you learned about AI through the process

Peer Review

Do This: Exchange your presentation with a peer and provide your feedback below.

Peer's name: _____

Peer feedback questions:

I like ...

I wonder if ...

I wish ...

Do This: Read your peer's feedback and make any final changes to your presentation.

Day 2 Reflection

1. How did you use AI to brainstorm, develop, or refine your presentation? Describe how you worked with AI to shape your final product.

2. What finishing touches do you need to add to your presentation before tomorrow?

Day 3: Finalize Project

Finalizing Your Project

Do This: Make final edits to your presentation to get it ready to share with others.

End of Project Reflection

1. How did you make sure your own voice and perspective are clear in your prediction and presentation—not just AI's ideas?

2. Looking back on your work with AI, what did it do well? What did it struggle with?

3. What responsibilities do humans have when using AI? How can we make sure AI is used in fair, ethical, and thoughtful ways?

Project Rubric

Criteria	Extensive Evidence	Convincing Evidence	Limited Evidence	No Evidence
Evaluating AI-Generated Predictions	Student accurately identifies unrealistic, incorrect, or hallucinated elements in AI outputs and refines them using evidence and reasoning.	Student identifies at least one inaccuracy or hallucination and attempts to revise the output.	Student identifies issues in AI predictions but does not revise or improve the output.	Student accepts AI outputs as-is with no critical analysis or revision.
Multimodal Input Exploration	Student uses multiple input types (e.g., text, image, PDF) and explains how each one contributes to the AI output or product. The use of inputs is clearly documented and connected to decisions made during the process.	Student uses more than one input type and explains how at least one input contributed to the AI output or product. Some connection to the process is present.	Student uses multiple input types, but their connection to the AI output or product is unclear or inconsistently applied.	Student uses only one input type, or additional inputs are included but not used to influence or inform the AI output or product.
Prompt Iteration and Refinement	Student revises prompts multiple times, with changes that result in clearly improved or more targeted AI responses. Revisions show increasing control over the content or quality of AI output.	Student revises prompts more than once and makes changes that noticeably influence the AI's response.	Student revises prompts once, but changes are minimal or do not appear to impact the AI's response.	Student uses only one prompt or reuses the same prompt without making any changes.
Bias & Ethical Awareness	Student identifies bias, missing perspectives, or potential harms in AI outputs and makes specific changes to improve fairness, representation, or ethical responsibility.	Student acknowledges at least one bias or ethical concern and makes one or more changes to improve fairness, inclusivity, or representation.	Student mentions bias or ethical concerns but does not make changes to address them.	Student does not identify or address bias, ethical concerns, or missing perspectives in AI output.

Reflection and Process Awareness	Student describes multiple decisions made while working with AI and explains how those decisions affected their prediction or presentation. Reflection includes what they learned about AI's strengths and limitations.	Student describes at least one decision made while working with AI and gives some explanation of how it shaped their prediction or presentation.	Student mentions working with AI or making changes but does not explain their decisions or reflect on the experience.	Student provides no explanation of their collaboration with AI or how their process influenced the final product.
Presentation and Synthesis	Final product explains the steps the student took to create and refine their prediction using AI. The presentation includes specific examples of prompt changes, decisions made, and how the student shaped or revised the output. The student clearly revises AI-generated content and presents it in their own voice.	Final product describes how the student worked with AI and includes at least one example of a prompt change or revision. Some student reasoning is present, and AI-generated content is partially revised or blended with student input.	Final product mentions using AI but includes few or no examples of prompt changes, revisions, or reasoning. The product relies heavily on unedited AI content, with little evidence of student input or voice.	Product is missing, incomplete, or does not describe how the student worked with AI or contributed to the final output.
